1 Executive summary Introduction

The EBA has launched a consultation paper on the supervisory handbook on the validation of IRB rating systems which provides some general guidance regarding the expectations of the validation function, as well a detailed description of the areas whereby the validation function is expected to form an opinion on

1- Background

The EBA has to develop and maintain a supervisory handbook on the supervision of financial institutions in the Union which is to set out **supervisory best practices and high-quality methodologies and processes** and takes into account, inter alia, changing business practices and business models and the size of financial institutions and markets.

The IRB validation is mostly described in the **CRR** as well as in **CRD** which provides a general description of the activities and objective of the validation function, as well as the assessment methodology.

Nevertheless, the EBA has identified some heterogeneity in the expectations of competent authorities (CA) relative to the validation function.

2.- Overview of the Handbook

The supervisory handbook provides some general guidance on the expectations relative to the validation function:

- 1. Clarification of the <u>specificities of the validation</u> in the context of the prudential framework, in terms of corporate governance and structural independence from the CRCU.
- 2. General description of the requirements applicable to the validation function.
- 3. Description of the validation tasks: tasks related to the pure model performance assessment and the ones dealing with the modelling environment.
- 4. Applicable requirements in the context of a first or recurrent validation.
- 5. Specific aspects which may trigger specific validation challenges.

3- Next steps

• The draft supervisory handbook is published for a *three months* consultation period (until 28 October 2022). The responses received during the consultation period will be taken into account when specifying the final handbook.

2 Context of validation function Three layers of defence

The assessment of the model performance is performed by several functions: i) credit risk control unit (CRCU); ii) the validation function and ii) the Internal Audit (IA). However, the EU regulation requires institutions to set up a specific independent validation function with its own responsibilities

Validation function and CRCU

Independence of the validation function vis-à-vis the CRCU:

The validation function assesses the final model developed by the CRCU. Thus, the independence of the validation function shall be ensured. There are two criteria:

- The structural independence ensured via the organisational setup.
- The sufficient resource allocation.

The <u>outcome of the validation function's</u> analyses allows to:

- i. understand the identified model deficiencies
- ii. decide on a remediation action plan
- iii. to have a good understanding of how these deficiencies are addressed in the risk estimates

In order to maintain its independence, the validation function is expected <u>not to advise CRCU</u> on how to improve certain aspects or to rectify deficiencies

CRCU

Communication of the findings and recommendations:

Validation
function and

Assessment of the validation function and rating systems:

The validation and IA functions constitute different levels of defence and should not be combined.

The IA function should have an **independent opinion** on the institution's validation function, which encompasses:

- i. The independence of the validation function.
- ii. The institution's validation policy and the adherence of the validation function to it,
- ii. The comprehensiveness and clarity of its conclusion and the related documentation produced, including the validation report
- iv. The appropriateness and timeliness of the follow up of the validation function's findings

On top of the assessment of the validation function, the IA is responsible for assessing the **regulatory compliance of the rating systems** of the institutions, which requires:

- i. An overview of the rating systems and related risks to ensure the <u>adequacy of own funds requirements</u> (including assessment of the model risk, corporate governance and test fulfilment).
- ii. An overview of all the operations related to rating systems (includes an annual review of the <u>performance</u> of each rating system). IA can take into consideration the analyses performed by the validation function, where appropriate. Nevertheless, IA should be responsible of their completeness.
- iii. A detailed assessment of the <u>elements not assessed by the validation function</u> (e.g review of the proper implementation of each rating system).

IA

General requirements

Scope, reports and tasks

Validation function is expected to assess the materiality of all model changes and extensions

1. Scope

The internal validation should be conducted at **each level** where a CA has granted an approval for a rating system. The responsibility of the validation tasks shall be retained by the validation function of the entity at the level of which the rating system has been approved.

What if a rating system is used at different levels of a group of entities?

- The validation functions are expected to share their findings and come up with an opinion on the corrective actions against any identified model deficiency or underestimation of risk parameters.
- The validation functions should come up to an agreement on whether a deficiency identified at a certain level is an indication of a **general deficiency at group level**.
- Institutions must ensure the **sufficient capitalisation** at all relevant levels, taking into account the validation functions.

2. Validation Policy and Report

The validation function should form an opinion on whether the final rating system developed by the CRCU meets the **regulatory requirements**. The validation function should come up with:

- A list of the deficiencies identified.
- An **assessment of the consequences** of these deficiencies.
- An assessment of the level of confidence in the results of its assessments.

The validation policy is expected to describe the validation framework, i.e. the roles, responsibilities, processes and content of the validation activities that need to be performed.

The validation report is expected to describe:

- the relevant tests performed to challenge the rating system
- the outcomes of the validation analyses
- the inclusion of a comparison between the latest results of the validation and the ones observed in the previous years

3. Validation tasks

- 1 Institutions shall have robust systems in place to validate the accuracy and consistency of rating systems, which encompasses:
- An assessment of CRCU's work and related documentation.
- Development of own empirical challengers (using new set of data not used during the development of the rating system).
- 2 Institution are expected to define and implement validation methods and procedures that are **consistent** across rating systems as well as through time. (e.g. ensure the changes in the validation policy are recorded and highlighted).
- $\bf 3$ In addition to assess the model in terms of performance, the validation function is expected
- to assess the materiality of all model changes and extensions and their combined effects by:
- Qualitative assessment
- Quantitative assessment

Initial validation vs. recurrent validation

Risk differentiation

The guidelines differentiate between initial and recurrent validations to determine the actions to be taken by entities within the validation process.

		Initial validation	Recurrent validation	
Risk differentiation	Rating assignment process	replicated by a third party. It is also necessary to assess both the quality and quantity	Conclusions drawn from previous validations can be re-used, although possible new deficiencies (such as those detected by internal audit) have to be taken into account. Materiality analysis of non-standard (expired/unrated) ratings is also expected to be performed.	
	Input data	the representativeness of the development sample with respect to the current	The validation function can use the previous assessment for the data quality and the completeness. A representativeness analysis should also be performed taking into account the analysis performed by the CRCU (paragraph 218(a) of the PD and LGD estimation guidelines).	>
	Modelling Choices	 Revision of the choices: Check that the drivers indicated by the regulation⁽¹⁾ are included. Possible outliers in LGD realised. The use of external ratings to segment. Hyperparameters: In case they (e.g. depth or number of leaves in a decision tree) are used, both expert decisions & quantitative results will have to be reviewed Rating segments: Check that the proposed segments are clear and not too granular. The number of segments should be reviewed to ensure that they meet the regulatory minimum 		
	Quantitative Analyses & Validation		since the last validation and since the last model approval date. As the initial validation, it is expected to assess the impact and number of overrides, the stability of the ratings, relationship between obligor grades in terms of the level of	

The validation function is expected to assess the impact and number of overrides, the default risk, the use of external data and the potential concentration in rating grades.

Challengers

stability of the ratings, relationship between obligor grades in terms of the level of default risk, the use of external data and the potential concentration in rating grades.

Initial validation vs. recurrent validation Risk quantification

The guidelines differentiate between initial and recurrent validations to determine the actions to be taken by entities within the validation process.

		Initial validation	Recurrent validation
: quantification	Input data and methodology	The data used shall be reviewed to verify that any uncertainty is covered through a MoC. Assumptions made to estimate the PD such as the LGD, the long-run-average-DR:, the length of the historical period or the choice of calibration samples, the choice of the LR period, the maximum period of recoveries, the length of the historical period and possible adjustments made will also be reviewed. The quantification of the MoCs will also be reviewed as well as their application, especially that the application of MoCs always increases the parameters. The choice of the DT period for LGD and CCF will be reviewed as well as its duration and severity.	methodology of the Long-Run average will be analysed and, in the event that the previous validation did not comply with the minimum number of years required , validation will have to verify that there has been a recalibration of the model . It is recommended to review the evolution of the MoCs through the evolution of their corresponding uncertainties.
Risk	Additional tests	Additional tests will have to be carried out to verify both the data and the methodological choices implemented by the CRCU performing a back-test of risk parameter estimates and the accuracy of model prediction and best estimate calibration. The rating philosophy of the model should be considered in these tests	· · ·

Initial validation vs. recurrent validation

Other specifications

The guidelines differentiate between initial and recurrent validations to determine the actions to be taken by entities within the validation process.

	variation process.		
		Initial validation	Recurrent validation
Other specific points	Exposures in default	In the case of LGD-in-default and ELBE, the same analysis must be performed as for LGD, but instead of taking the date of default, the reference date must be taken. In this regard, attention should be paid to the definition of the reference date, the non-inclusion of MoCs in the ELBE and the consistency between the ELBE and LGD-in-default.	The LGD will be reviewed to ensure that there are no major changes including the most recent sample as well as the definitions of the reference dates and the recovery policies. Regarding the ELBE, the possible adjustments related to economic conditions applied will be reviewed while for the LGD in default the MoCs will also have to be reviewed.
	CRM	recovery flows allowed. In addition, it will be verified that recoveries are assigned in	As for the rest of the tests, the same tests can be carried out as in previous validations with the most recent data.
	Slotting approach	Because PD and LGD parameters are not used, some tasks in the validation process are different: In case Al does not review the allocation within the specialised funding subcategories, it will have to be reviewed by internal validation. Both the selection of relevant information, the rating criteria and the aggregation of relevant information must be verified. The rest of the tests will be similar to a normal portfolio, number of overrides.	due to mature. As the initial validation, it is expected to assess the impact and number of overrides, the stability of the ratings, relationship between obligor grades in terms of the level of

Initial validation vs. recurrent validation Model environment

The guidelines differentiate between initial and recurrent validations to determine the actions to be taken by entities within the validation process.

		Initial validation	Recurrent validation
ment	Data quality	validated, and on the other hand, the sample application of the model will have to be validated.	Validation is expected to review the data quality document submitted to senior management, as well as the CRCU's treatment of the deficiencies detected, especially if they have been addressed with a MoC. The validation function is expected to monitor the comprehensiveness of the assignment process.
Model environ	IT implementation	Check that the functional and business requirements defined by the methodology team are translated into the IT infrastructures . To this end, the functional documentation of the system must be analysed. Ensure that the implementation of the <i>Rating System</i> in the systems complies with the regulations and reproduces what is documented under the model under review . This will be done by verifying that UATs of the model under implementation have been performed. <i>Walk-through</i> sessions of the validation team and the IT team are recommended to understand this test plan and its implementation.	to the model have been duly reflected in the functional and business requirements.

Validation challenges

External Data, Outsourcing and Data scarcity

The EBA focuses on three aspects which may trigger specific validation challenges:
i) the use of external data in the model development; ii) the outsourcing of validation task and iii) the validation in the context of data scarcity

External Data

The validation of a rating system which is built on external data is expected to follow the following five principles:

- Representativeness: Analysing whether the use of external data is appropriate. Divergences in ratings assignments to counterparties may occur.
- Access to data: possibility to request any further analyses from the data provider
- Methodological choices' assessment: the validation function is expected to assess whether any bias has been introduced
- **Performance assessment**: quantitative evaluation of the rating system performance is expected to be performed first on internal data.
- Data quality: The external data is not expected to be treated differently than internal data in terms of data quality assessment.

Outsourcing of validation tasks

When outsourcing operational tasks, it is expected that an institution **complies with the regulatory requirements** (e.g. EBA GL on outsourcing). Therefore, among others:

- The validation function remains responsible of its validation policy, validation methodology and the final assessment on the rating system. As a result, the management of the validation function will remain responsible for all validation activities.
- The institution outsourcing policy plays an important role.
- The communication with Competent Authority should start as early as possible.
- The outsourcing must be clear and transparent (properly documented).

Data scarcity

The validation of ratings systems in a context of data scarcity brings some additional challenges:

- Creation of **specific metrics**, paying special attention to the interpretation of the results obtained for the application of statistical challengers or tools.
- Complementary analyses to **supplement quantitative measures**, such as descriptive statistics or visual analyses
- Where it is **not feasible to apply certain statistical tests** it can be used a comparison with internal credit expert ranking or OOT and OSS validation samples.

6 List of consultations Questions

This consultation document seeks to gather the views of all stakeholders through six questions

- 1a) How is the split between the first and the subsequent validation implemented in your institution?

 1b) Do you see any constraints in implementing the proposed expectations (i) as described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in section 4 for the first validation for a) newly described in the first validation for a large first validation first validation for a large first validation for a large first validation first validatio
 - 1b) Do you see any constraints in implementing the proposed expectations (i) as described in section 4 for the first validation for a) newly developed models; and b) model changes; and (ii) as described in section 5 for the subsequent validation of unchanged models?
- For rating systems that are used and validated across different entities, do you have a particular process in place to share the findings of all relevant validation functions? Do you apply a singular set of remedial action across all the entities or are there cases where remedial actions are tailor-made to each level of application?
- 3a) Do you deem it preferential to split the review of the definition of default between IRB-related topics and other topics?

 3b) If you do prefer a split in question 3a, which topics of the definition of default would you consider to be IRB-related, and hence should be covered by the internal validation function?
- Which approach factoring in the rating philosophy of a model into the back-testing analyses should be considered as best practices?
- What analyses do you consider to be best practice to empirically assess the modelling choices in paragraph [76] and, more generally, the performance of the slotting approach used (i.e. the discriminatory power and homogeneity)?
- 6a) Which of the above mentioned approaches do you consider as best practices to assess the performance of the model in the context of data scarcity?

 6b) More in general, which validation approaches do you consider as best practices to assess the performance of the model in the context of data scarcity?

Why Management Solutions? Summary of capabilities and credentials

Management Solutions has differential expertise in IRB related projects and with extensive experience working with supervisors and in main European financial institutions in the scope of IRB models and internal validation frameworks

Supervisory experience: selected as a reference consultant, being best valued service provider by different regulators in the area of IRB models.

Deep knowledge of supervisory expectations provided by practical experience.

Vast experience in the area of internal validation in main G-SIBs y D-SIBs: framework and guidelines, model validation, automatization and development and implementation of related tools

Top class team with multidisciplinary profiles and skills (regulatory knowledge, modelling, IV, ...), proven delivery capacity and track record of projects developed with outstanding results

Deep knowledge of regulation and its application in top institutions and vast experience in the European financial industry in the area of IRB providing us with a global perspective of our clients' needs and allowing us to provide differential QA capabilities

Best-in-class experts and R&D team with distinctive capabilities in Capital IRB, international perspective and knowledge of European financial institutions, providing differential benchmarking capacities
